Executive insights

- Supermarket Type 1 drives 65.5% of total sales.
- Fruits & Vegetables is the top category at 178,124 in sales.
- Low Fat products contribute 64.6% of total sales.
- 17.2% of records have missing Item Weight.
- Outlet-size inconsistencies found in: OUT010, OUT017, OUT045.

1. Executive summary

The dataset contains 8,523 records and generates total sales of 1,201,681.49. Average sales per record are 140.99, while the average customer rating is 3.97/5. The commercial picture is dominated by supermarket-format outlets, while product-category performance is concentrated in a small number of large categories.

2. Commercial performance

Supermarket Type 1 contributes 787,549.89, approximately 65.5% of total sales. The leading product category is Fruits and Vegetables (178,124.08), followed by Snack Foods (175,433.92). This indicates that assortment and execution in these categories should receive disproportionate management attention.

3. Product mix

Low Fat products account for 64.6% of sales. However, average sales per record are close between Low Fat and Regular products, suggesting that the aggregate difference is largely a volume/mix effect rather than a major per-record productivity advantage.

4. Outlet footprint and trend

Tier 3 locations lead aggregate sales at 472,133.03. Because average sales per record are broadly similar across location tiers, aggregate differences appear more related to outlet/record coverage than radically different transaction productivity.

5. Data and analytics risks

1,463 records (17.2%) are missing Item Weight. Outlet size is inconsistent within the following outlet IDs: OUT010, OUT017, OUT045. These issues should be resolved or explicitly handled before predictive modeling, outlet benchmarking or automated KPI reporting.

6. Recommended management actions

1) Prioritize availability, assortment and promotional execution for the highest-sales categories. 2) Benchmark Supermarket Type 1 practices and identify which operational characteristics can be replicated elsewhere. 3) Treat visibility and rating as supporting diagnostics rather than standalone sales drivers. 4) Establish a governed outlet master table so outlet-level attributes such as size are consistent. 5) Impute Item Weight using a documented methodology and retain a missingness flag for downstream models.
